The Southeast  
Conservation  
Adaptation Strategy

SECAS

The Southeast Conservation Blueprint 2022

PR & USVI

[THIS PAGE INTENTIONALLY LEFT BLANK]

# About the Southeast Blueprint

The Southeast Conservation Blueprint is the primary product of the [Southeast Conservation Adaptation Strategy](#) (SECAS). It is a living, spatial plan to achieve the SECAS vision of a connected network of lands and waters across the Southeast and Caribbean. The Blueprint is regularly updated to incorporate new data, partner input, and information about on-the-ground conditions.

Across 15 states of the Southeast, the Blueprint identifies priority areas based on a suite of natural and cultural resource indicators representing terrestrial, freshwater, and marine ecosystems. A connectivity analysis identifies corridors that link coastal and inland areas and span climate gradients. This portion of the Southeast Blueprint is referred to as the "Base Blueprint".

To provide more complete coverage of the SECAS geography, the Blueprint incorporates two additional input plans: the Florida Marine Blueprint for marine areas in Florida and the Caribbean Landscape Conservation Design for inland areas in Puerto Rico.

For more information:

- Visit the [Blueprint webpage](#)
- Review the [Blueprint 2022 Development Process](#)
- View and download the Blueprint data and make maps on the [Blueprint page of the SECAS Atlas](#)

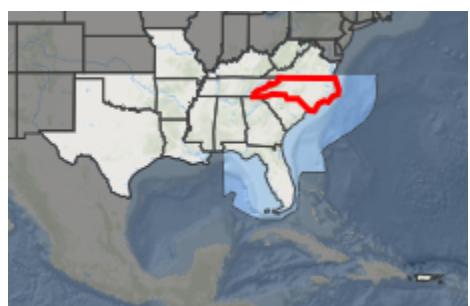

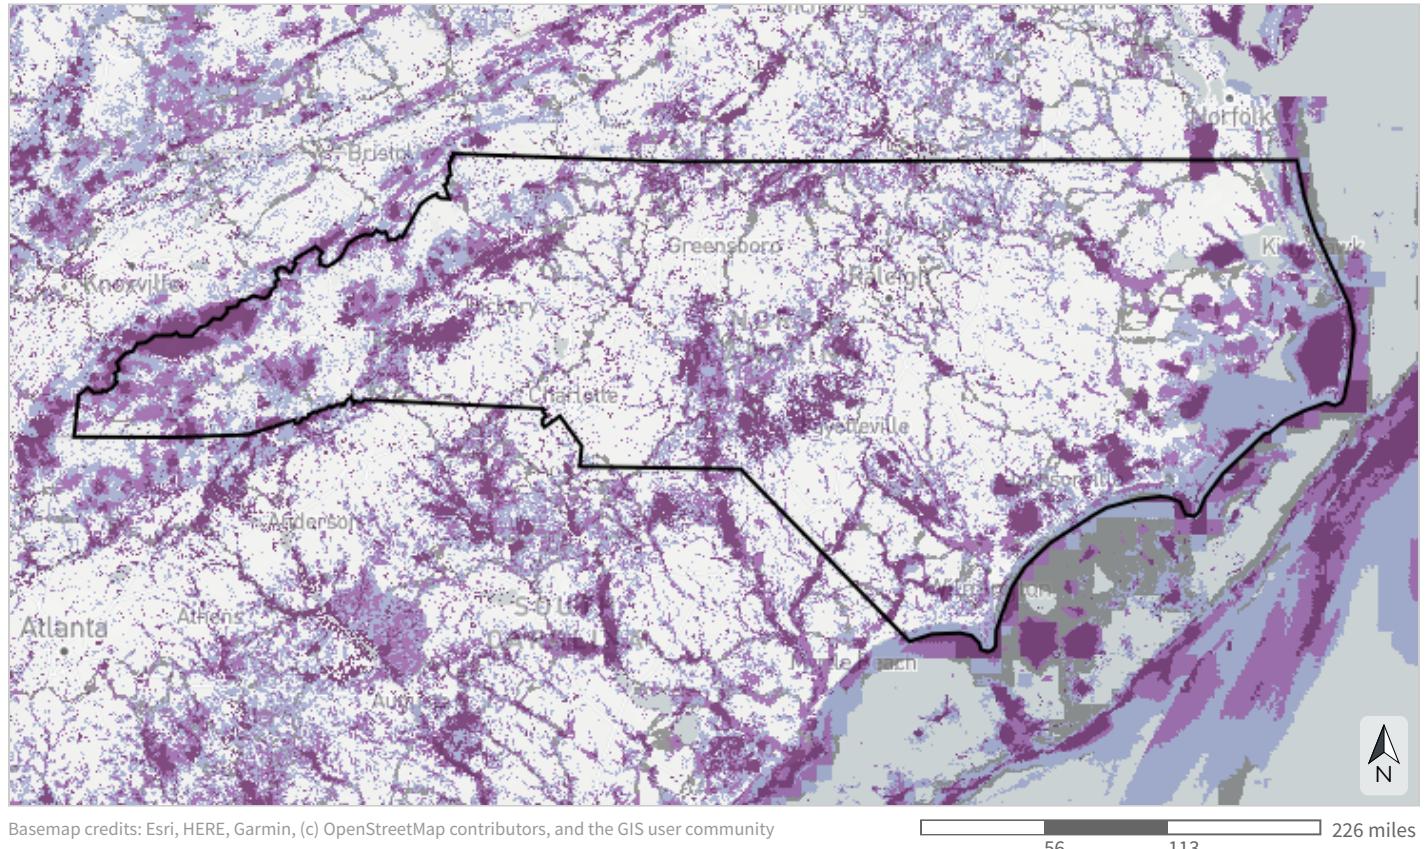

## We're here to help!

- Do you have a question about the Blueprint?
- Would you like help using the Blueprint to support a proposal or inform a decision?
- Do you have a suggestion on how to improve the Blueprint? The Blueprint and its inputs are regularly revised based on input from people like you.
- Do you have feedback on how to improve the Simple Viewer interface?

If you need help or have questions, [contact Southeast Blueprint staff](#) by reaching out to a member of the user support team.

We're here to support you. We really mean it. It's what we do!

# Southeast Blueprint Priorities

## Priorities for a connected network of lands and waters

- Highest priority
- High priority
- Medium priority
- Priority connections

# Priority Categories

## For a connected network of lands and waters

In total, Blueprint priorities and priority connections cover roughly 50% of the Southeast Blueprint geography.

### Highest priority

Areas where conservation action would make the biggest impact, based on a suite of natural and cultural resource indicators. This class covers roughly 10% of the Southeast Blueprint geography.

### High priority

Areas where conservation action would make a big impact, based on a suite of natural and cultural resource indicators. This class covers roughly 15% of the Southeast Blueprint geography.

### Medium priority

Areas where conservation action would make an above-average impact, based on a suite of natural and cultural resource indicators. This class covers roughly 20% of the Southeast Blueprint geography.

### Priority connections

Connections between priority areas that cover the shortest distance possible while routing through as much Blueprint priority as possible. This class covers roughly 5% of the Southeast Blueprint geography.

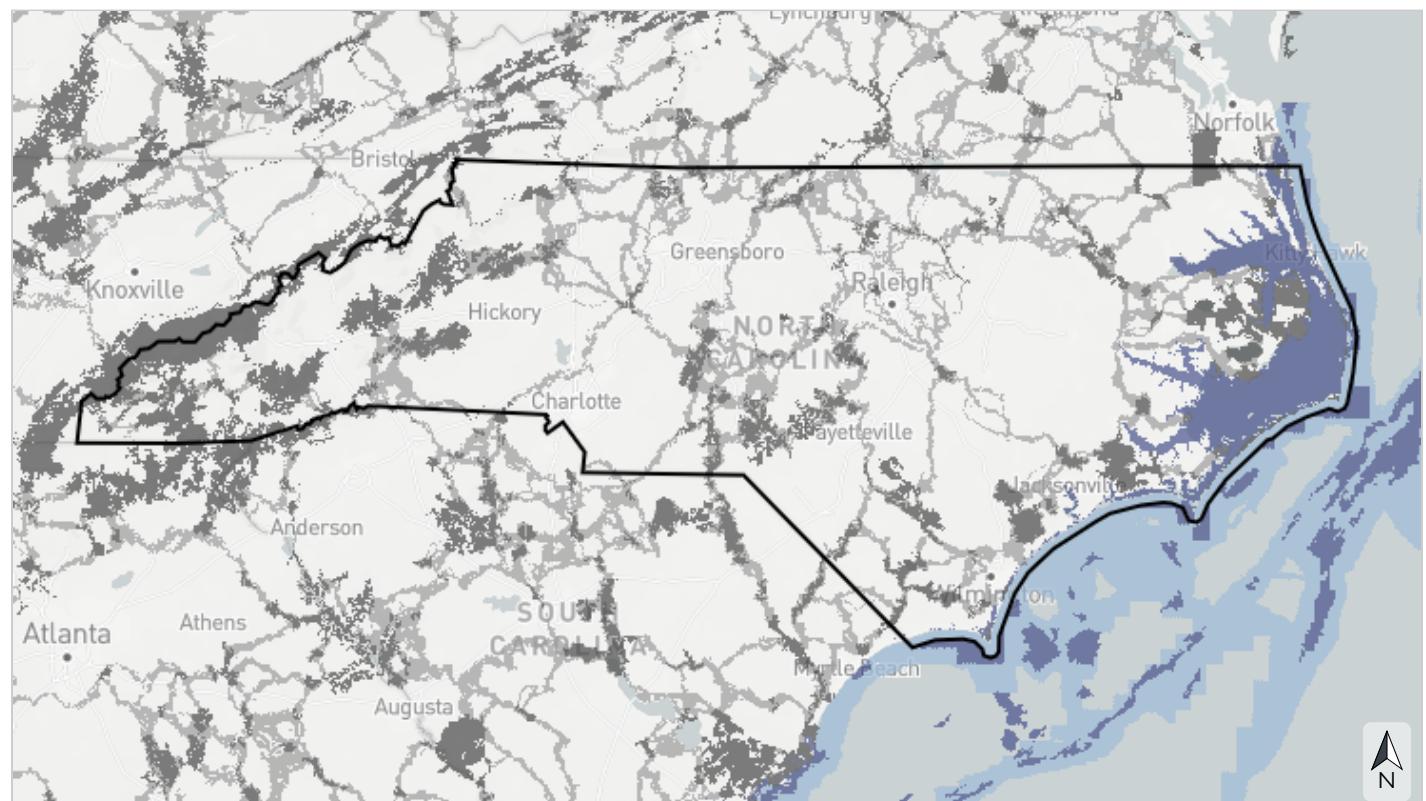

Table 1: Extent of each Blueprint priority category.

Priority Category	Acres	Percent of Area
Highest priority	3,639,298	10.6%
High priority	4,903,496	14.2%
Medium priority	6,857,270	19.9%
Priority connections	1,447,534	4.2%
Lower priority	17,596,232	51.1%
<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

## Hubs and Corridors

The Blueprint uses a least-cost path connectivity analysis to identify corridors that link hubs across the shortest distance possible, while also routing through as much Blueprint priority as possible.

Inland hubs are large patches (~5,000+ acres) of highest priority Blueprint areas and/or protected lands, connected by inland corridors. Marine and estuarine hubs are large estuaries and large patches (~5,000+ acres) of highest priority Blueprint areas. Marine and estuarine corridors connect those hubs within broad marine mammal movement areas.

## East Coastal Plain open pine birds

This indicator identifies areas within the historic longleaf pine range east of the Mississippi River where creating or maintaining open pine habitat would most benefit six focal species of birds (Bachman's sparrow, red-cockaded woodpecker, Henslow's sparrow, red-headed woodpecker, Northern bobwhite, brown-headed nuthatch). It prioritizes areas for open pine conservation based on suitability for longleaf pine, feasibility of prescribed burning, proximity to protected lands, habitat suitability for focal bird species, and proximity to source bird populations. It originates from the East Gulf Coastal Plain Joint Venture's prioritization of areas for open pine ecosystem restoration.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

56      113      226 miles

- High priority for open pine conservation for focal bird species (Bachman's sparrow, red-cockaded woodpecker, Henslow's sparrow, red-headed woodpecker, Northern bobwhite, and brown-headed nuthatch) (score >80-100)
- Medium-high priority (score >60-80)
- Medium priority (score >40-60)
- Medium-low priority (score >20-40)
- Low priority for open pine conservation for focal bird species (score 0-20)

*Table 6: Indicator values for East Coastal Plain open pine birds in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	High priority for open pine conservation for focal bird species (Bachman's sparrow, red-cockaded woodpecker, Henslow's sparrow, red-headed woodpecker, Northern bobwhite, and brown-headed nuthatch) (score >80-100)	0	0%
	Medium-high priority (score >60-80)	2,223	<0.1%
	Medium priority (score >40-60)	328,341	1.0%
	Medium-low priority (score >20-40)	1,115,518	3.2%
↓ Low	Low priority for open pine conservation for focal bird species (score 0-20)	1,390,728	4.0%
	<i>Area not evaluated for this indicator</i>	31,607,021	91.8%
	<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

Terrestrial

## Equitable access to potential parks

This cultural resource indicator prioritizes places to create new parks that would fill gaps in equitable access to open space within socially vulnerable communities. It identifies areas where residents currently lack access to parks within a 10-minute walk (accounting for walkable road networks and access barriers like highways and fences), then prioritizes based on park need using demographic and environmental metrics. Parks help improve public health, foster a conservation ethic by providing opportunities for people to connect with nature, and support critical ecosystem services. This indicator originates from the Trust for Public Land's ParkServe park priority areas.

- Very high priority for a new park that would create nearby equitable access
- High priority for a new park that would create nearby equitable access
- Moderate priority for a new park that would create nearby equitable access

*Table 7: Indicator values for equitable access to potential parks in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Very high priority for a new park that would create nearby equitable access	168,102	0.5%
	High priority for a new park that would create nearby equitable access	223,385	0.6%
↓ Low	Moderate priority for a new park that would create nearby equitable access	180,159	0.5%
	<i>Area not evaluated for this indicator</i>	33,872,184	98.3%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

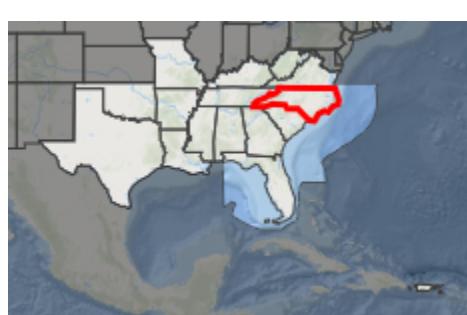

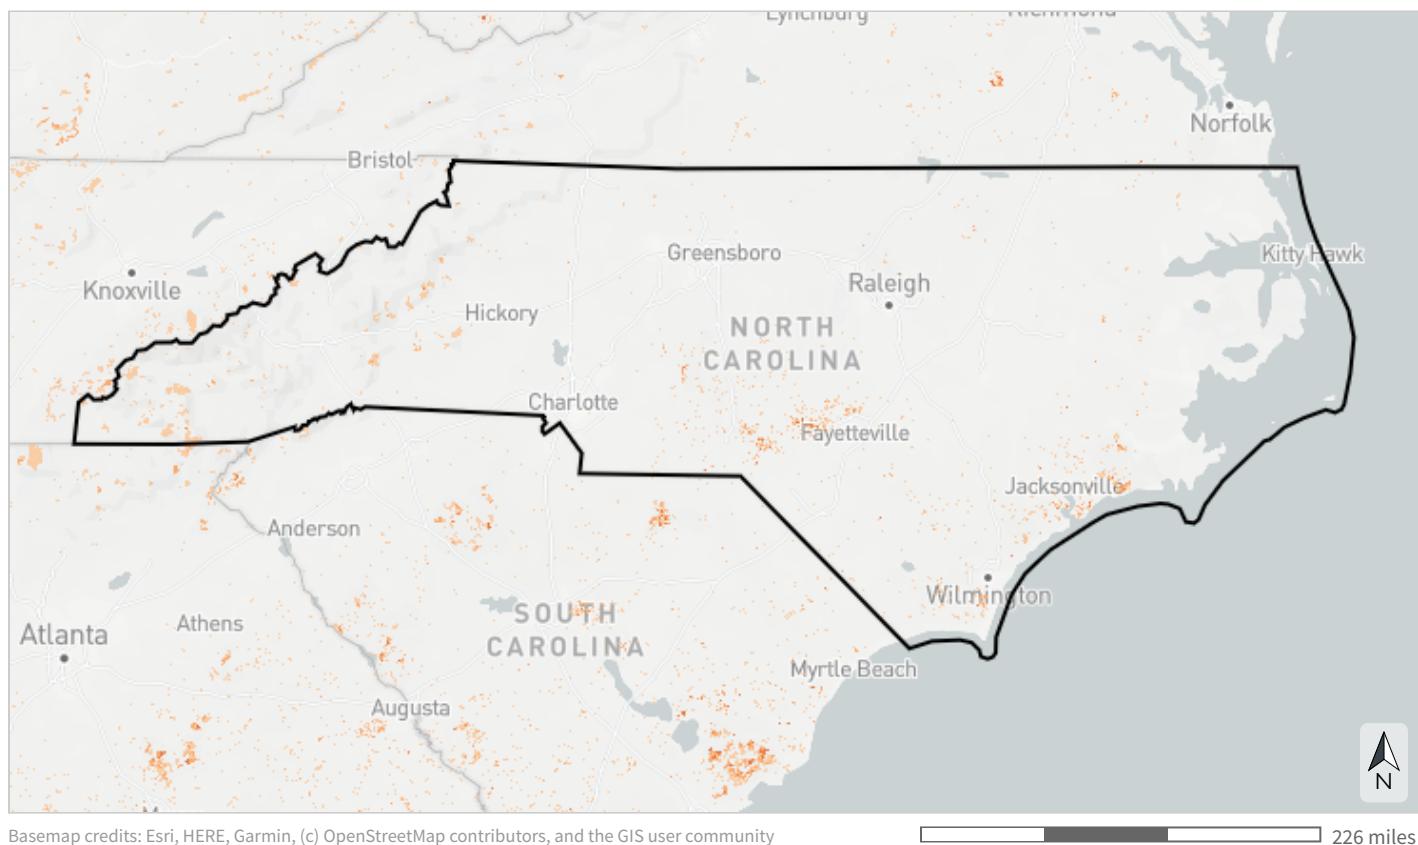

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## Fire frequency

This indicator uses remote sensing to estimate the number of times an area has been burned from 2013 to 2021. Many Southeastern ecosystems rely on regular, low-intensity fires to maintain habitat, encourage native plant growth, and reduce wildfire risk. This indicator combines burned area layers from both U.S. Geological Survey Landsat data and the inter-agency Monitoring Trends in Burn Severity program. Landsat-based fire predictions within the range of longleaf pine are also available through Southeast FireMap.

- Burned 3+ times from 2013-2021
- Burned 2 times from 2013-2021
- Burned 1 time from 2013-2021
- Not burned from 2013-2021 or row crop

*Table 8: Indicator values for fire frequency in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Burned 3+ times from 2013-2021	12,470	<0.1%
	Burned 2 times from 2013-2021	54,036	0.2%
	Burned 1 time from 2013-2021	420,556	1.2%
↓ Low	Not burned from 2013-2021 or row crop	33,944,884	98.6%
	<i>Area not evaluated for this indicator</i>	11,884	<0.1%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

↑ In good condition

↓ Not in good condition

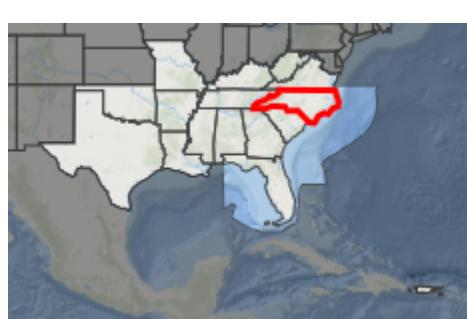

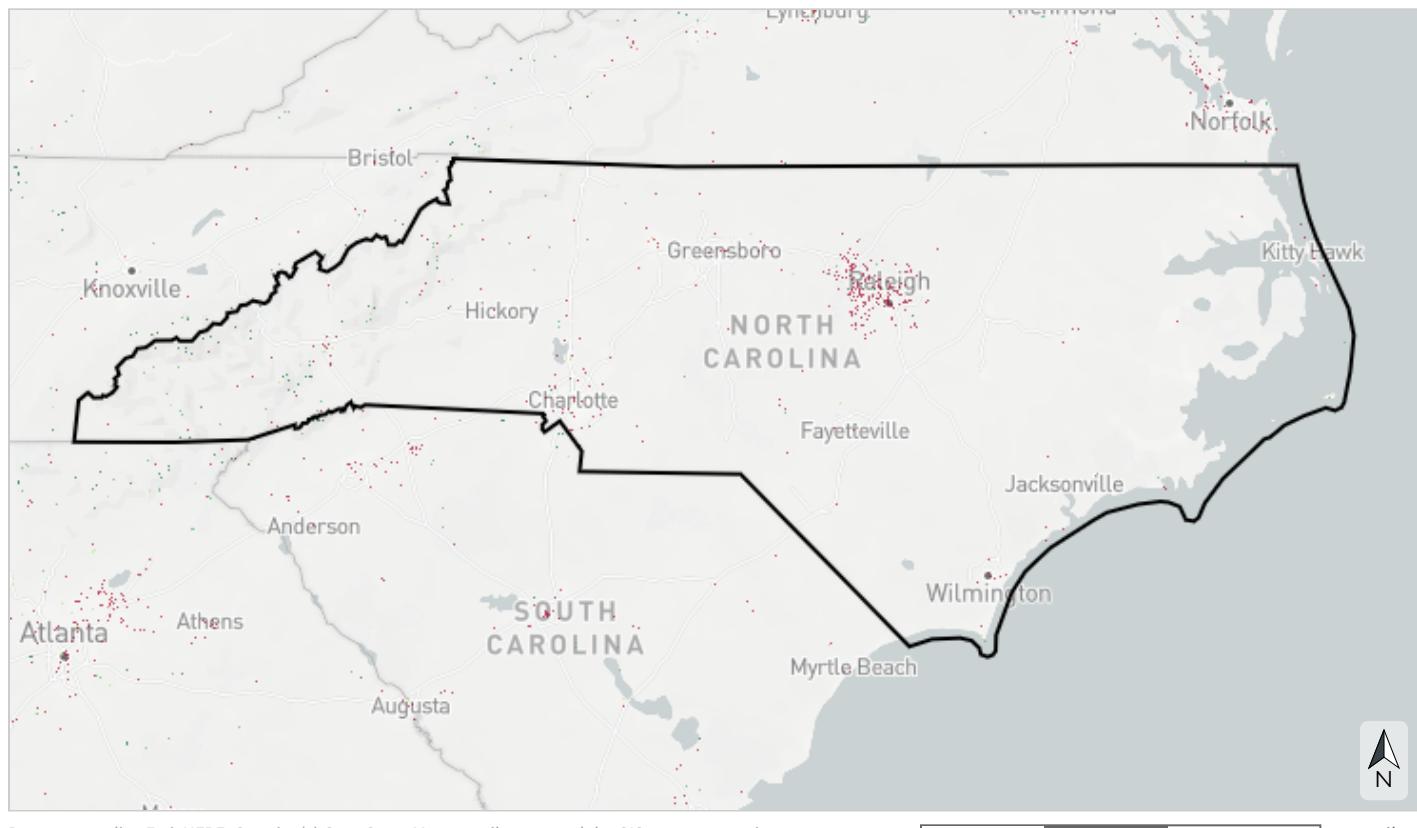

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## Greenways & trails

This cultural resource indicator measures both the natural condition and connected length of greenways and trails to characterize the quality of the recreational experience. Natural condition is based on the amount of impervious surface surrounding the path. Connected length captures how far a person can go without leaving a dedicated path, based on common distances for walking, running, and biking. This indicator originates from OpenStreetMap.

- Mostly natural and connected for  $\geq 40$  km
- Mostly natural and connected for 5 to  $<40$  km or partly natural and connected for  $\geq 40$  km
- Mostly natural and connected for 1.9 to  $<5$  km, partly natural and connected for 5 to  $<40$  km, or developed and  $\geq 40$  km
- Mostly natural and connected for  $<1.9$  km, partly natural and connected for 1.9 to  $<5$  km, or developed and connected for 5 to  $<40$  km
- Partly natural and connected for  $<1.9$  km or developed and connected for 1.9 to  $<5$  km
- Developed and connected for  $<1.9$  km
- Sidewalk or other path

Table 9: Indicator values for greenways & trails in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Mostly natural and connected for ≥40 km	15,271	<0.1%
	Mostly natural and connected for 5 to <40 km or partly natural and connected for ≥40 km	16,768	<0.1%
	Mostly natural and connected for 1.9 to <5 km, partly natural and connected for 5 to <40 km, or developed and ≥40 km	8,888	<0.1%
	Mostly natural and connected for <1.9 km, partly natural and connected for 1.9 to <5 km, or developed and connected for 5 to <40 km	2,319	<0.1%
	Partly natural and connected for <1.9 km or developed and connected for 1.9 to <5 km	2,930	<0.1%
	Developed and connected for <1.9 km	621	<0.1%
↓ Low	Sidewalk or other path	109,643	0.3%
	<i>Area not evaluated for this indicator</i>	34,287,390	99.5%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

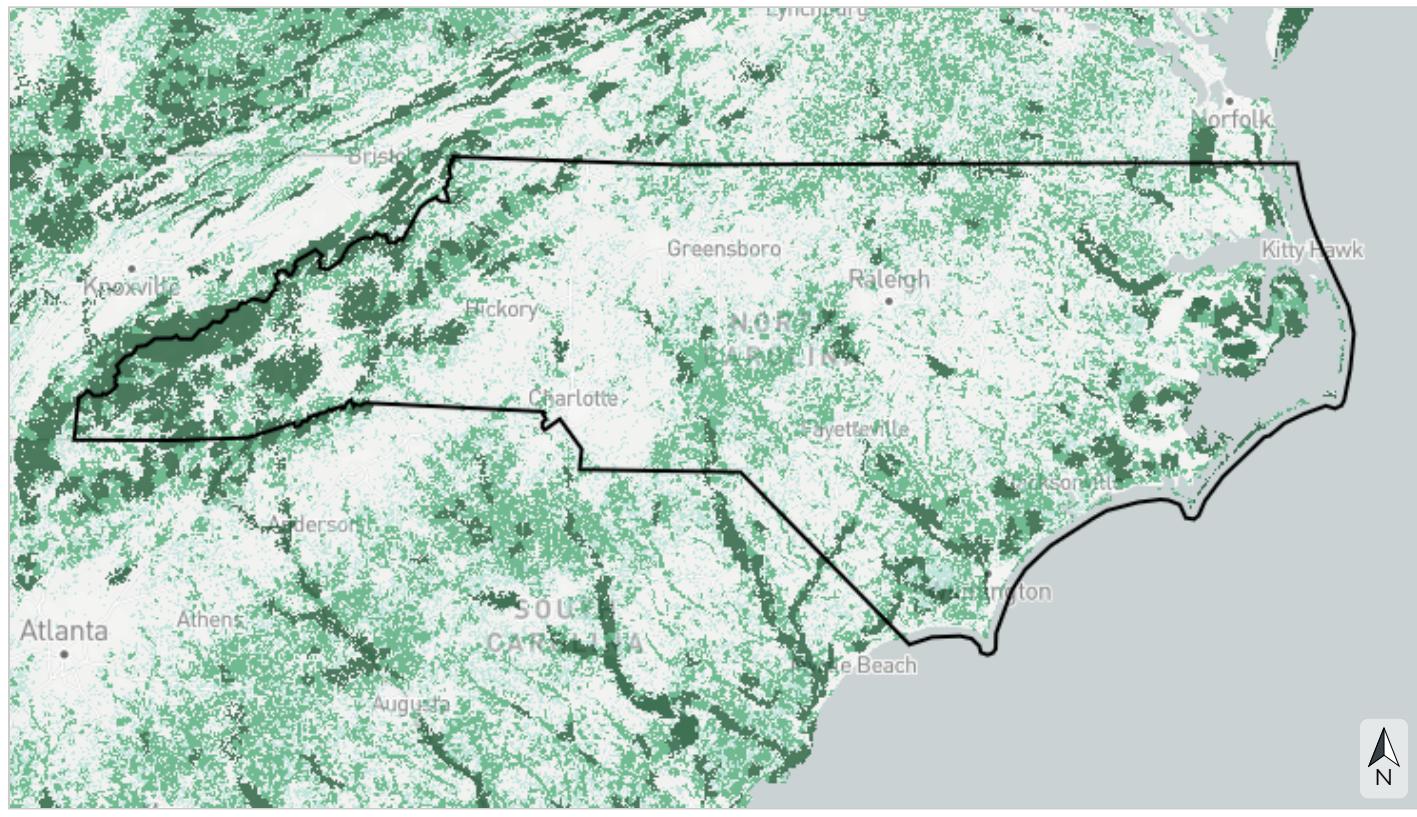

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## Intact habitat cores

This indicator represents the size of large, unfragmented patches of natural habitat. It identifies minimally disturbed natural areas at least 100 acres in size and greater than 200 meters wide. Large areas of intact natural habitat are important for many wildlife species, including reptiles and amphibians, birds, and large mammals. This indicator originates from Esri's green infrastructure data.

- Large core (>10,000 acres)
- Medium core (>1,000-10,000 acres)
- Small core (>100-1,000 acres)
- Not a core

*Table 10: Indicator values for intact habitat cores in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Large core (>10,000 acres)	4,091,498	11.9%
	Medium core (>1,000-10,000 acres)	6,541,968	19.0%
	Small core (>100-1,000 acres)	3,882,134	11.3%
↓ Low	Not a core	19,916,346	57.8%
	<i>Area not evaluated for this indicator</i>	11,884	<0.1%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

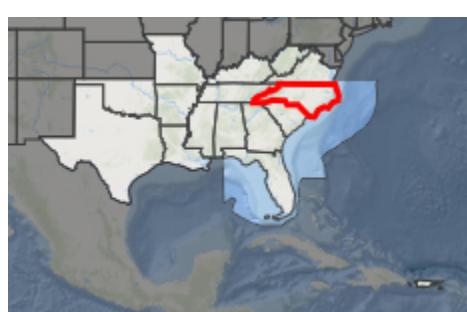

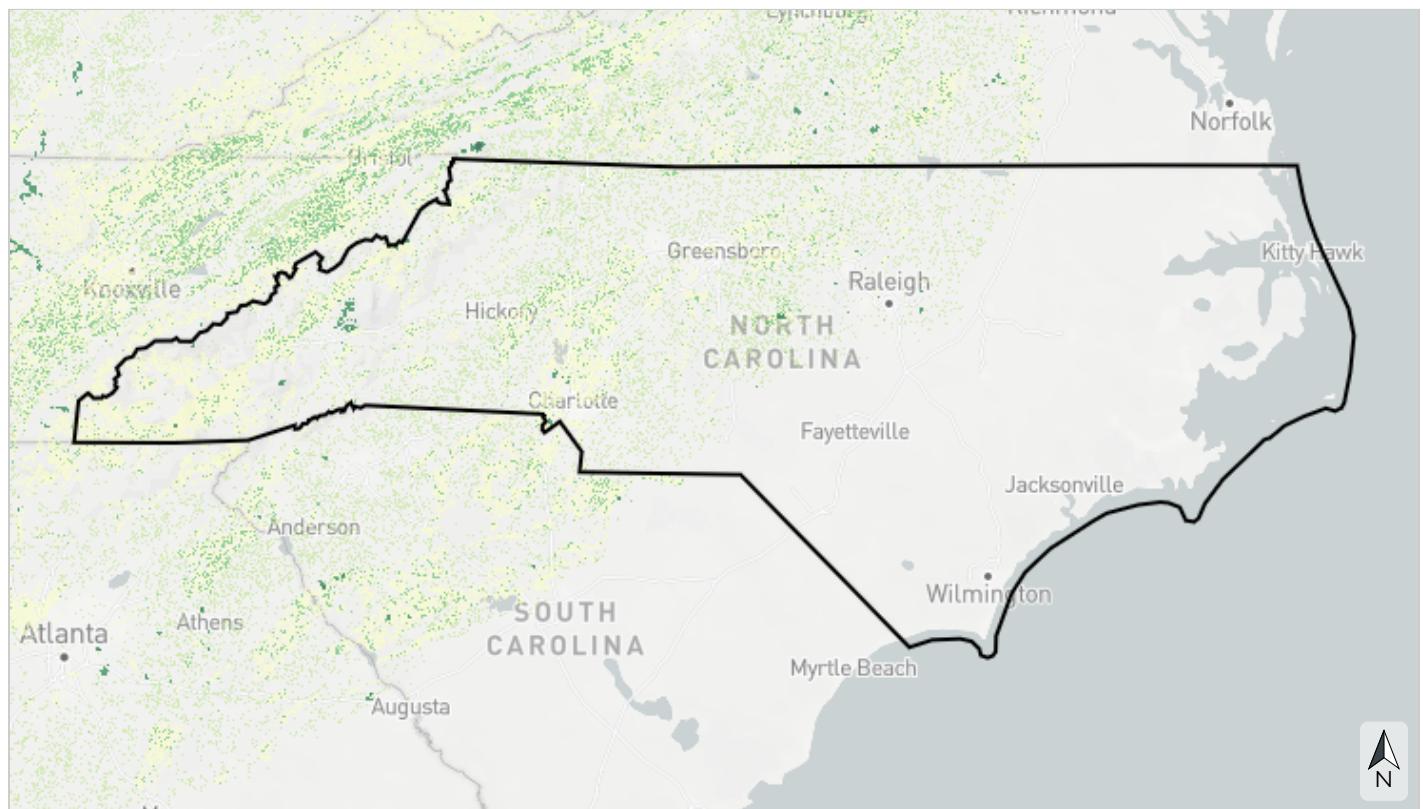

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## Interior Southeast grasslands

This indicator represents grasslands in the interior southeastern United States, which support important plants, birds, and pollinators. It includes grasslands with and without trees that are historically maintained by geology (e.g., outcrops, glades, and barrens), fire (e.g., Piedmont prairies), and/or the regular violent flooding on the banks of high-energy rivers known as “riverscour” (e.g., riverscour prairies). Known grasslands receive the highest scores, followed by bumble bee habitat buffers around known sites, areas in potentially compatible management, and restoration opportunities within grassland geology. This indicator combines data from multiple sources, including the Southeastern Grasslands Initiative, the Central Hardwoods Joint Venture, the Rangeland Analysis Platform, and The Nature Conservancy.

- Known grassland
- Known grassland buffer
- Potentially compatible management within grassland geology (undeveloped powerline right-of-way or perennial forbs and grasses)
- Potentially compatible management outside of grassland geology (undeveloped powerline right-of-way or perennial forbs and grasses)
- Grassland geology
- Grassland less likely

*Table 11: Indicator values for Interior Southeast grasslands in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Known grassland	3,163	<0.1%
	Known grassland buffer	54,585	0.2%
	Potentially compatible management within grassland geology (undeveloped powerline right-of-way or perennial forbs and grasses)	291,382	0.8%
	Potentially compatible management outside of grassland geology (undeveloped powerline right-of-way or perennial forbs and grasses)	1,794,975	5.2%
↓ Low	Grassland geology	2,232,195	6.5%
	Grassland less likely	12,622,893	36.6%
	<i>Area not evaluated for this indicator</i>	17,444,637	50.6%
	<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

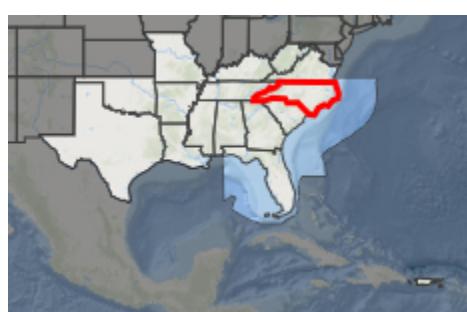

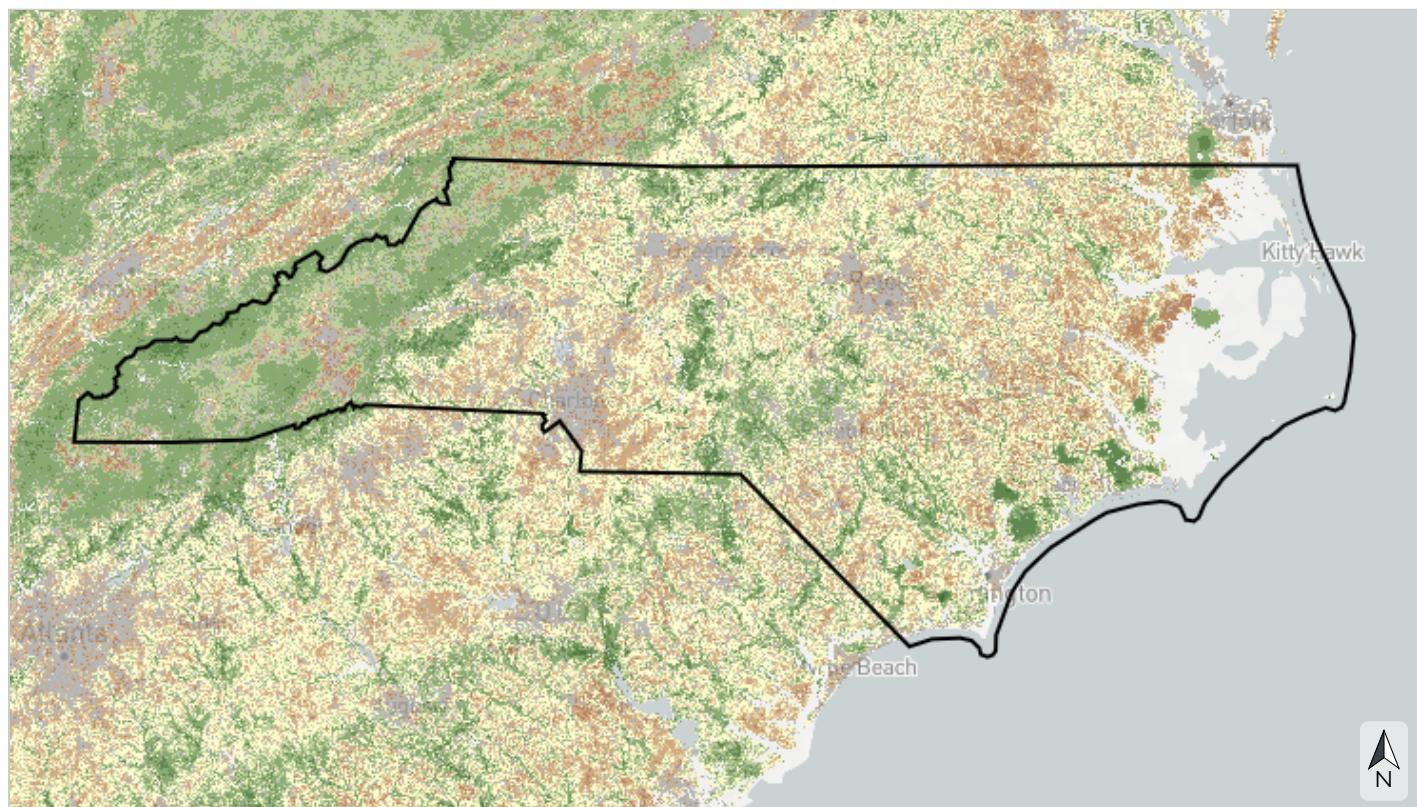

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## Resilient terrestrial sites

This indicator depicts an area's capacity to maintain species diversity and ecosystem function in the face of climate change. It measures two factors that influence resilience. The first, landscape diversity, reflects the number of microhabitats and climatic gradients created by topography, elevation, and hydrology. The second, local connectedness, reflects the degree of habitat fragmentation and strength of barriers to species movement. Highly resilient sites contain many different habitat niches that support biodiversity, and allow species to move freely through the landscape to find suitable microclimates as the climate changes. This indicator originates from The Nature Conservancy's Resilient Land data.

- Most resilient
- More resilient
- Slightly more resilient
- Average/median resilience
- Slightly less resilient
- Less resilient
- Least resilient
- Developed

*Table 12: Indicator values for resilient terrestrial sites in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Most resilient	897,721	2.6%
	More resilient	5,385,116	15.6%
	Slightly more resilient	3,980,535	11.6%
	Average/median resilience	7,267,817	21.1%
	Slightly less resilient	3,317,387	9.6%
	Less resilient	3,143,594	9.1%
	Least resilient	667,530	1.9%
	Developed	4,155,850	12.1%
<i>Area not evaluated for this indicator</i>		5,628,280	16.3%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

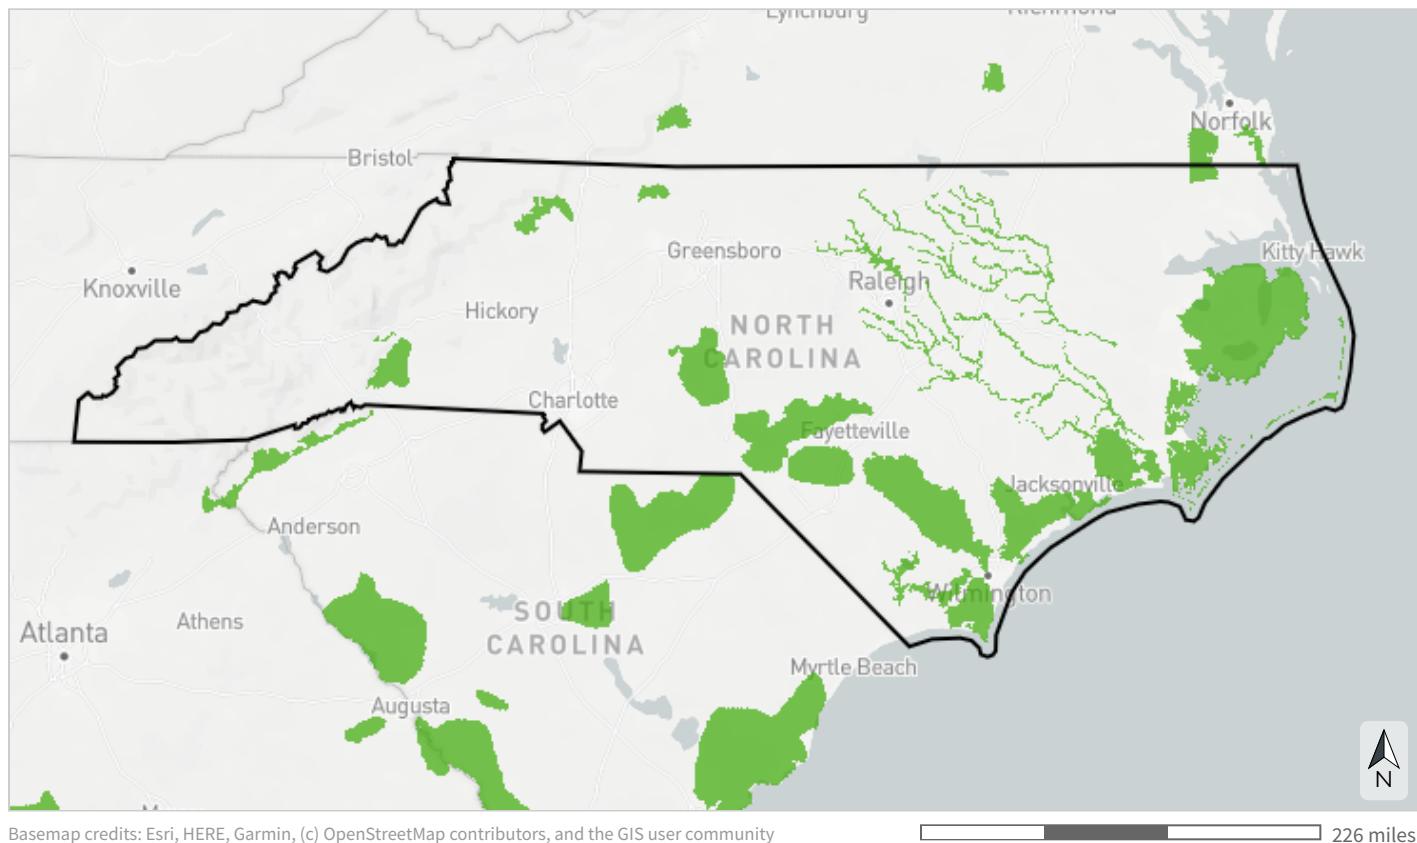

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## South Atlantic amphibian & reptile areas

This indicator represents Priority Amphibian and Reptile Conservation Areas (PARCAs) in the South Atlantic. PARCA is an expert-driven, nonregulatory designation that includes places capable of supporting viable amphibian and reptile populations, places occupied by rare or imperiled species, and places rich in biodiversity or species unique to that geographic area (i.e., endemism).

[Legend:  
■ Priority Amphibian and Reptile Conservation Area (PARCA)  
□ Not a Priority Amphibian and Reptile Conservation Area (PARCA)]

*Table 13: Indicator values for South Atlantic amphibian & reptile areas in this area. A good condition threshold is not yet defined for this indicator.*

	Indicator Values	Acres	Percent of Area
↑ High	Priority Amphibian and Reptile Conservation Area (PARCA)	4,717,314	13.7%
↓ Low	Not a Priority Amphibian and Reptile Conservation Area (PARCA)	24,845,785	72.1%
	<i>Area not evaluated for this indicator</i>	4,880,731	14.2%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

## Priority Amphibian and Reptile Conservation Areas:

### Bladen Lakes

The Bladen Lakes PARCA encompasses a largely rural landscape that includes a series of public lands with high ecological value. Extensive areas of unprotected land could serve as habitat connectors between these public lands, if managed for conservation. Priority conservation species known to occur in the PARCA include southern hognose snake, mimic glass lizard, ornate chorus frog, and pine barrens treefrog.

### Carolina Bays

Located in the upper Coastal Plain, the Carolina Bays PARCA encompasses a particularly dense concentration of unique Carolina bay wetlands. The bays in this PARCA are known to have supported exceptionally large numbers of rare pond breeding amphibians. Though some species have likely been lost from this area, priority species known to remain include the eastern tiger salamander, oak toad, dwarf salamander, eastern chicken turtle, southern chorus frog, and Mabee's salamander. Only very small areas of the PARCA are currently managed as natural habitat, though a high potential for conservation exists with future habitat restoration and management.

### Croatan Forest

Dominated by Croatan National Forest, the Croatan PARCA also includes many pieces of adjacent unprotected land. A hotspot of diversity for reptiles and amphibians, conservation measures taken on some of these additional lands would prove highly beneficial. Species of note in the Croatan PARCA include gopher frog, ornate chorus frog, southern chorus frog, oak toad, Mabee's salamander, mimic glass lizard, eastern chicken turtle and pygmy rattlesnake.

### Great Dismal Swamp

No description available for PARCAs in Virginia

### Green Swamp

Encompassing large tracts of managed habitat as well as significant areas of currently unprotected lands, the Green Swamp PARCA is known to support small populations of priority conservation species, including the northern pine snake, mimic glass lizard, eastern chicken turtle and southern chorus frog. A high potential for conservation exists with the restoration of exceptionally large areas of currently

undeveloped, but highly degraded, habitats.

### **Hickory Nut Gorge**

The Hickory Nut Gorge PARCA represents steep, rocky gorges, riverine floodplain, low to mid-elevation rock outcrop, granitic dome, and rocky bald habitats, and includes large tracts of public land. Focal species include timber rattlesnake, coal skink, a disjunct population of green salamander, and two endemics – crevice salamander and Blue Ridge gray-cheeked salamander.

### **Holly Shelter Lejeune**

Largely comprised of Angola Bay, Stone's Creek, and Holly Shelter game lands, along with Marine Corps Base Camp Lejeune, the Holly Shelter Lejeune PARCA supports an extremely high diversity of reptiles and amphibians. Additionally, although these public land holdings are near or adjacent to one another, many opportunities for unprotected land conservation exist. Focal amphibian species include gopher frog, ornate chorus frog, southern chorus frog, and oak toad. Conservation concerns regarding reptiles include the best remaining North Carolina population of eastern diamondback rattlesnake, good populations of chicken turtle, and nesting habitat for the loggerhead sea turtle.

### **Neuse Tar River**

The Neuse Tar River PARCA follows the flows of the Neuse and Tar Rivers. Flowing from the Piedmont to the Coastal Plain, these two long rivers make up the entire known range of the Neuse River waterdog, a salamander endemic to North Carolina. Other priority species found within this PARCA include lesser siren and rainbow snake.

### **Northern Fall Line Sandhills**

This region comprises much of the Fall Line-Sandhill habitat in South Carolina between the Wateree River and the North Carolina state line. Like Fort Jackson, this area is characterized by deep, droughty sands dissected by small blackwater streams that typically support pocosin habitat along their margins. The uplands would have supported longleaf pine historically, and periodic fire would have played a role in maintaining this forest. Within the existing forest, there are areas of bare sand in addition to sandstone and ironstone outcrops. This region contains the only known extant populations of the state threatened pine barrens treefrog in South Carolina. This area also contains records for the state threatened southern hognose snake and the pine snake.

### **Pamlico**

The Pamlico PARCA covers a very large area of the Pamlico Sound along with a large landmass in the Alligator River area. This PARCA is important for many species of turtles, both freshwater and saltwater. The nesting beaches on the ocean side in this area are not the highest density in the state, but they tend to be the coolest, hence they likely produce the least female-biased sex ratio of hatchlings. This, in turn, may become increasingly important in the face of climate change and projected warming in the region. The Pamlico Sound and adjacent creeks are hotspots for sea turtles, including loggerhead, Kemp's ridley, and green turtles. They are also known to support good populations of diamondback terrapins. The freshwater sites within the Pamlico PARCA support large populations of spotted turtles as well as many other species.

## **Sandhills**

Characterized by deep, well-drained soils, the Sandhills originally supported an extensive fire-maintained, longleaf pine-wiregrass community. The Sandhills PARCA includes several large tracts of public land that are managed as natural habitat as well as extensive areas of buffer and possible landscape-scale habitat connectors. Priority conservation species including the southern hognose snake, northern pine snake, eastern chicken turtle, eastern tiger salamander, pine barrens treefrog, and gopher frog still occur in limited numbers in the Sandhills PARCA.

## **Sauratown Mountains**

Rising sharply over 1,000 feet above the surrounding landscape, the Sauratown Mountains dominate the scenery of the Sauratown PARCA. These Piedmont monadnocks consist of forested ridges occasionally broken by open, rocky cliffs. Focal species include Wehrle's salamander and timber rattlesnake.

## **South Brunswick**

The South Brunswick PARCA encompasses an area known to support an exceptionally diverse array of habitats and associated species, including the northern pine snake, eastern chicken turtle, and gopher frog. While most of the remaining habitat in this PARCA is currently found on private property, a few small areas of high quality lands are managed with public resources. Significant potential for conservation exists in the South Brunswick PARCA.

## **South Carolina Blue Ridge Escarpment**

South Carolina's Blue Ridge Escarpment is a region where the Blue Ridge Mountains meet the Atlantic Piedmont region. This region is characterized by high rainfall, lush cove forests, bare rocky cliffs, and numerous small streams and rivers. All of the known locations for the newly described patchnose salamander and dwarf blackbelly salamander, green salamander, federally threatened bog turtle, state endangered coal skink, timber rattlesnake, shovelnose salamander and seepage salamander are contained within this region.

## **South Mountains**

The rugged landscape of the South Mountains chain, combined with cool and clear streams, create a unique topographical oasis in the western Piedmont of North Carolina known as the South Mountains PARCA. Elevations rising up to 3,000 feet provide habitat for both the timber rattlesnake and the narrowly endemic South Mountain gray-cheeked salamander.

## **Uwharrie Mountains**

The Uwharries PARCA contains some of the largest remaining tracts of wildlife and rare plant habitat in the North Carolina Piedmont and includes much of the Uwharrie Mountains, among the oldest mountain ranges in North America. Species of conservation concern known to occur in the Uwharries PARCA include mole salamander, four-toed salamander, and timber rattlesnake.

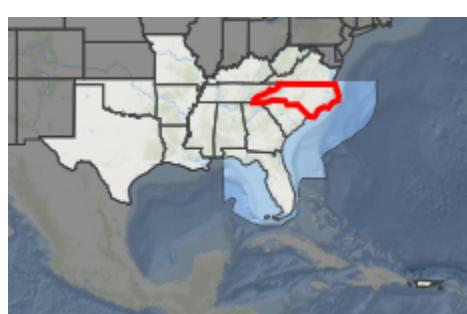

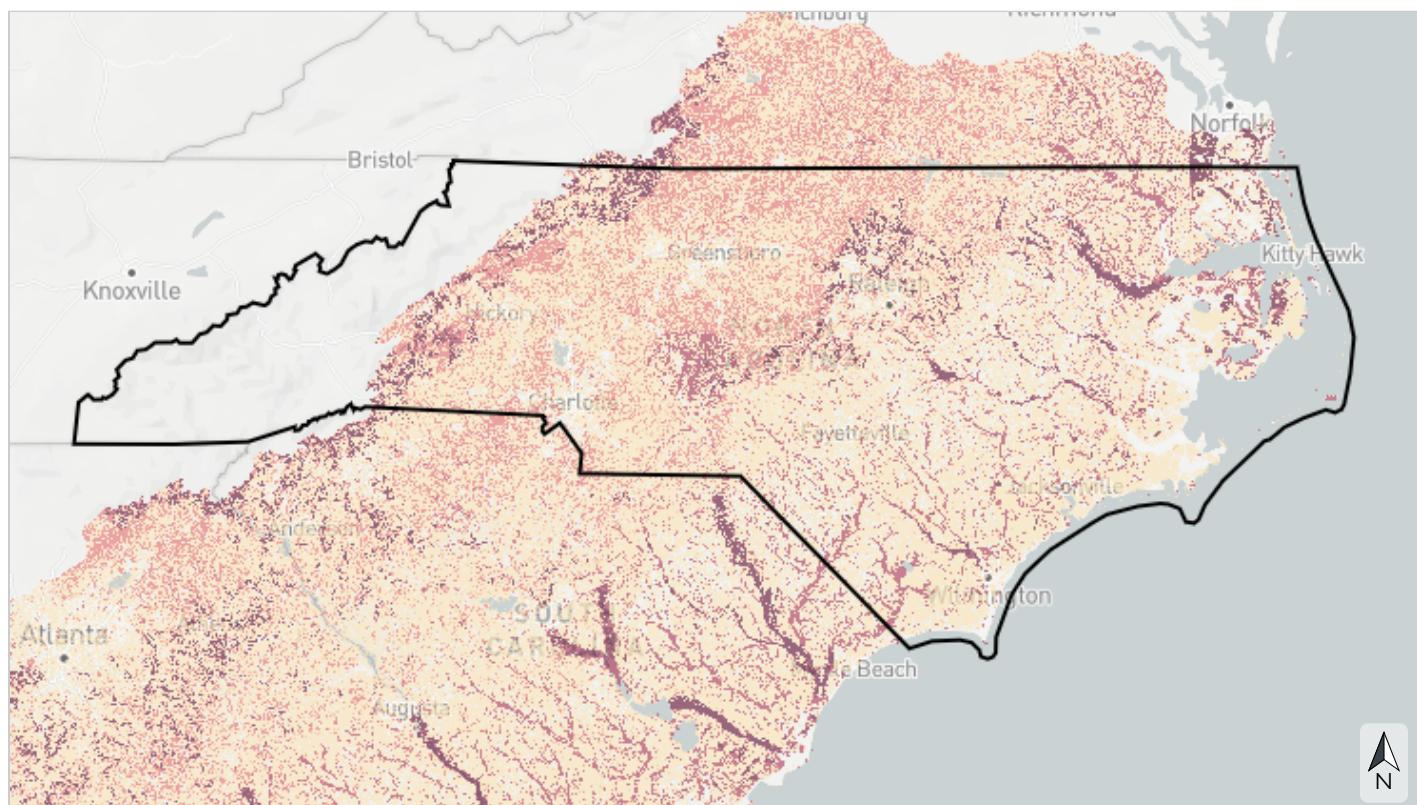

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

Terrestrial

## South Atlantic forest birds

This indicator is an index of habitat suitability for twelve upland hardwood and forested wetland bird species (wood thrush, whip-poor-will, American woodcock, red-headed woodpecker, Chuck-will's widow, hooded warbler, Kentucky warbler, Acadian flycatcher, Northern parula, black-throated green warbler, prothonotary warbler, Swainson's warbler) based on patch size and other ecosystem characteristics such as proximity to water and proximity to forest and ecotone edge. The needs of these species are increasingly restrictive at higher index values, reflecting better quality habitat. This indicator originates from Southeast Gap Analysis Program and Designing Sustainable Landscapes bird habitat models.

- Very large patches near water (potential for presence of Swainson's warbler)
- Large patches often near water (potential for presence of Northern parula, black-throated green warbler, or Prothonotary warbler)
- Medium patches (potential for presence of Acadian flycatcher)
- Small patches often near water (potential presence of hooded warbler or Kentucky warbler)
- Very small patches or near open areas (potential for presence of wood thrush, whip-poor-will, red-headed woodpecker, Chuck-will's widow, or American woodcock)
- Less potential for presence of forest bird index species

*Table 14: Indicator values for South Atlantic forest birds in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Very large patches near water (potential for presence of Swainson's warbler)	1,079,109	3.1%
	Large patches often near water (potential for presence of Northern parula, black-throated green warbler, or Prothonotary warbler)	1,854,317	5.4%
	Medium patches (potential for presence of Acadian flycatcher)	3,070,302	8.9%
	Small patches often near water (potential presence of hooded warbler or Kentucky warbler)	1,170,834	3.4%
↓ Low	Very small patches or near open areas (potential for presence of wood thrush, whip-poor-will, red-headed woodpecker, Chuck-will's widow, or American woodcock)	14,822,258	43.0%
	Less potential for presence of forest bird index species	7,566,216	22.0%
	<i>Area not evaluated for this indicator</i>	4,880,794	14.2%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

## South Atlantic low-urban historic landscapes

This cultural resource indicator is an index of sites on the National Register of Historic Places surrounded by limited urban development. It identifies significant historic places that remain connected to their context in the natural world. This indicator originates from the National Park Service and various state historic resource agencies.

- Historic place with nearby low-urban buffer
- Historic place with nearby high-urban buffer
- Not in the National Register of Historic Places

*Table 15: Indicator values for South Atlantic low-urban historic landscapes in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>	
↑ High	Historic place with nearby low-urban buffer	217,931	0.6%	↑ In good condition
	Historic place with nearby high-urban buffer	82,674	0.2%	
↓ Low	Not in the National Register of Historic Places	29,262,478	85.0%	↓ Not in good condition
	<i>Area not evaluated for this indicator</i>	4,880,747	14.2%	
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

Terrestrial

## Urban park size

This cultural resource indicator measures the size of parks larger than 5 acres in the urban environment. Protected natural areas in urban environments provide urban residents a nearby place to connect with nature, and offer refugia for some species. This indicator complements the equitable access to potential parks indicator by capturing the value of existing parks. It originates from the U.S. Geological Survey's Protected Areas Database and 2019 National Land Cover Database percent developed impervious layer.

- >75 acre urban park
- >50-75 acre urban park
- >30-50 acre urban park
- >10-30 acre urban park
- 5-10 acre urban park

*Table 16: Indicator values for urban park size in this area. A good condition threshold is not yet defined for this indicator.*

		<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	>75 acre urban park	131,344	0.4%	
	>50-75 acre urban park	10,054	<0.1%	
	>30-50 acre urban park	11,458	<0.1%	
	>10-30 acre urban park	15,551	<0.1%	
↓ Low	5-10 acre urban park	4,713	<0.1%	
	<i>Area not evaluated for this indicator</i>	34,270,711	99.5%

Freshwater

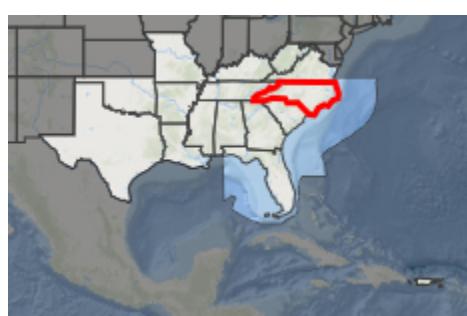

## Atlantic migratory fish habitat

This indicator measures the condition of migratory fish habitat along the Atlantic coast within each catchment, using metrics of water quality, aquatic connectivity, habitat fragmentation, flow alteration, and more. Areas of excellent fish habitat are already in good condition and face few threats; restoration opportunity areas are doing well in some respects, but restoration projects could significantly improve them; degraded areas of opportunity face many challenges, and restoration projects are unlikely to increase available fish habitat unless particularly large in scope and scale. This indicator originates from the Atlantic Coast Fish Habitat Partnership's fish habitat conservation area mapping and prioritization project.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

Freshwater

## Imperiled aquatic species

This indicator measures the number of aquatic animal Species of Greatest Conservation Need (SGCN) observed within each 12-digit HUC subwatershed, including fish, mussels, snails, crayfish, and amphibians. SGCN are identified in State Wildlife Action Plans as most in need of conservation action. This indicator captures patterns of rare and endemic species diversity not well-represented by other freshwater aquatic indicators. It originates from state Natural Heritage Program data collected by the Southeast Aquatic Resources Partnership and applies to the Environmental Protection Agency's estimated floodplain, which spatially defines areas estimated to be inundated by a 100-year flood, also known as the 1% annual chance flood.

8+ aquatic Species of Greatest Conservation Need (SGCN) observed
7 aquatic SGCN observed
6 aquatic SGCN observed
5 aquatic SGCN observed
4 aquatic SGCN observed
3 aquatic SGCN observed
2 aquatic SGCN observed
1 aquatic SGCN observed
No aquatic SGCN observed

*Table 18: Indicator values for imperiled aquatic species in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	8+ aquatic Species of Greatest Conservation Need (SGCN) observed	201,701	0.6%
	7 aquatic SGCN observed	64,118	0.2%
	6 aquatic SGCN observed	98,181	0.3%
	5 aquatic SGCN observed	94,400	0.3%
	4 aquatic SGCN observed	233,998	0.7%
	3 aquatic SGCN observed	749,316	2.2%
	2 aquatic SGCN observed	872,638	2.5%
	1 aquatic SGCN observed	1,488,587	4.3%
	No aquatic SGCN observed	1,378,712	4.0%
	<i>Area not evaluated for this indicator</i>	29,262,179	85.0%

Freshwater

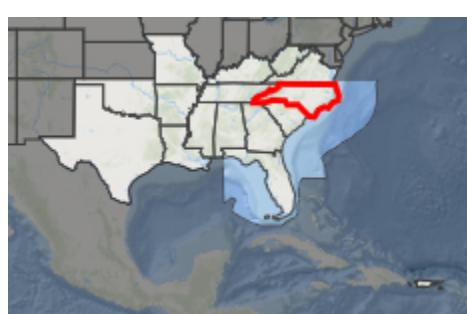

## Natural landcover in floodplains

This indicator measures the amount of natural landcover in the estimated floodplain of rivers and streams within each catchment. It assesses the stream channel and its surrounding riparian buffer, measuring the percent of unaltered habitat like forests, wetlands, or open water (rather than agriculture or development). Intact vegetated buffers within the floodplain of rivers and streams provide aquatic habitat, improve water quality, reduce erosion and flooding, recharge groundwater, and more. This indicator originates from the 2019 National Land Cover Database and applies to the Environmental Protection Agency's estimated floodplain, which spatially defines areas estimated to be inundated by a 100-year flood, also known as the 1% annual chance flood.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

Freshwater

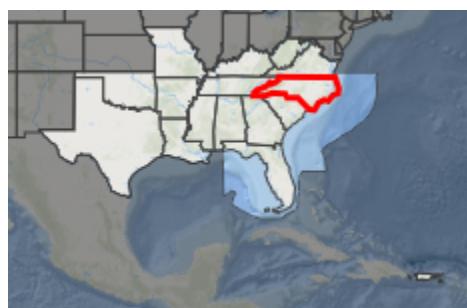

## Network complexity

This indicator depicts the number of different stream size classes in a river network not separated by dams or waterfalls. River networks with a variety of connected stream classes help retain aquatic biodiversity in a changing climate by allowing species to access climate refugia and move between habitats. This indicator originates from the Southeast Aquatic Resources Partnership and applies to the Environmental Protection Agency's estimated floodplain, which spatially defines areas estimated to be inundated by a 100-year flood, also known as the 1% annual chance flood.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

Scale: 56 113 226 miles

- 7 connected stream classes
- 6 connected stream classes
- 5 connected stream classes
- 4 connected stream classes
- 3 connected stream classes
- 2 connected stream classes
- 1 connected stream class

*Table 20: Indicator values for network complexity in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	7 connected stream classes	180,557	0.5%

## Freshwater

# Permeable surface

This indicator measures the average percent of non-impervious cover within each catchment. High levels of impervious surface degrade water quality and alter freshwater flow, impacting both aquatic species communities and ecosystem services for people, like the availability of clean drinking water. This indicator originates from the 2019 National Land Cover Database percent developed impervious layer.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

 226 miles

- >95% of catchment permeable (likely high water quality and supporting most sensitive aquatic species)
  - >90-95% of catchment permeable (likely declining water quality and supporting most aquatic species)
  - >70-90% of catchment permeable (likely degraded water quality and not supporting many aquatic species)
  - ≤70% of catchment permeable (likely degraded instream flow, water quality, and aquatic species communities)

Table 21: Indicator values for permeable surface in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>	
↑ High	>95% of catchment permeable (likely high water quality and supporting most sensitive aquatic species)	27,564,110	80.0%	↑ In good condition
	>90-95% of catchment permeable (likely declining water quality and supporting most aquatic species)	1,893,467	5.5%	↓ Not in good condition
	>70-90% of catchment permeable (likely degraded water quality and not supporting many aquatic species)	2,046,480	5.9%	
↓ Low	≤70% of catchment permeable (likely degraded instream flow, water quality, and aquatic species communities)	508,251	1.5%	
	<i>Area not evaluated for this indicator</i>	2,431,523	7.1%

Coastal &amp; marine

## Coastal shoreline condition

This indicator assesses shoreline condition based on the presence of hardened structures like jetties, groins, and riprap, as well as other human development. By restricting the natural movement of sediment, shoreline armoring increases erosion, prevents the inland migration of coastal ecosystems in response to sea-level rise, and degrades habitat for birds, sea turtles, fish, plants, and other species both on and offshore. Natural shorelines in harder-to-develop coastal areas receive the highest shoreline condition scores, while hardened shorelines receive the lowest scores. This indicator originates from the National Oceanic and Atmospheric Administration's Environmental Sensitivity Index dataset.

- Natural and harder to develop
- Natural
- Partially armored and harder to develop
- Partially armored
- Armored

Table 23: Indicator values for coastal shoreline condition in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>	
↑ High	Natural and harder to develop	25,189	<0.1%	↑ In good condition
	Natural	81,562	0.2%	
	Partially armored and harder to develop	77	<0.1%	
↓ Low	Partially armored	2,889	<0.1%	↓ Not in good condition
	Armored	10,763	<0.1%	
	<i>Area not evaluated for this indicator</i>	34,323,350	99.7%	
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

Coastal &amp; marine

## Estuarine coastal condition

This indicator combines measures of water quality, sediment quality, contaminants in fish tissue, and benthic community condition to create an overall index of coastal estuarine condition. Estuaries serve as important nursery habitat for wildlife, including many species of fish and shellfish eaten as seafood. They also improve water quality by filtering out sediments and pollutants, provide recreational opportunities, and support coastal economies. This indicator originates from the Environmental Protection Agency's National Coastal Condition Assessment data.

- Good
- Good to fair
- Fair
- Fair to poor
- Poor

Table 24: Indicator values for estuarine coastal condition in this area. Good condition thresholds reflect the range of indicator values that occur in healthy, functioning ecosystems.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Good	710,296	2.1%
	Good to fair	588,199	1.7%
	Fair	1,053,796	3.1%
↓ Low	Fair to poor	35,034	0.1%
	Poor	3,449	<0.1%
<i>Area not evaluated for this indicator</i>		32,053,055	93.1%

Coastal & marine  
**Islands**

This indicator represents important habitat for island-dependent species across the Southeast. Because the isolation of islands can make them ecologically unique and protect them from disturbance and mainland predators, they often serve as important habitat for many species of mammals, plants, and insects, as well as breeding coastal birds and sea turtles. The highest scores go to island critical habitat for six threatened and endangered animal and plant species: piping plover, loggerhead sea turtle, Cape Sable thoroughwort, Florida semaphore cactus, silver rice rat, and Bartram's hairstreak butterfly. This indicator originates from U.S. Fish and Wildlife Service critical habitat data and island boundaries from the U.S. Geological Survey and Esri.

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

56 113 226 miles

- Island critical habitat for any of six threatened and endangered species (piping plover, loggerhead sea turtle, Cape Sable thoroughwort, Florida semaphore cactus, silver rice rat, or Bartram's hairstreak butterfly)
- Island

*Table 25: Indicator values for islands in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Island critical habitat for any of six threatened and endangered species (piping plover, loggerhead sea turtle, Cape Sable thoroughwort, Florida semaphore cactus, silver rice rat, or Bartram's hairstreak butterfly)	13,202	<0.1%
↓ Low	Island	137,408	0.4%

Coastal &amp; marine

## Resilient coastal sites

This indicator depicts the capacity of coastal habitats to migrate to adjacent lowlands in order to sustain biodiversity and natural services under increasing inundation from sea-level rise. It is based on the physical and condition characteristics of current tidal complexes, their predicted migration space, and surrounding buffer areas. These characteristics include marsh complex size, shared edge with migration space, sediment balance, water quality, natural landcover, landform diversity, and many others. This indicator originates from The Nature Conservancy's Resilient Coastal Sites project.

- Most resilient
- More resilient
- Slightly more resilient
- Average/median resilience
- Slightly less resilient
- Less resilient
- Least resilient

*Table 26: Indicator values for resilient coastal sites in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Most resilient	0	0%
	More resilient	368,999	1.1%
	Slightly more resilient	303,702	0.9%
	Average/median resilience	687,523	2.0%
	Slightly less resilient	9,506	<0.1%
	Less resilient	6,410	<0.1%
	Least resilient	3,632	<0.1%
↓ Low	<i>Area not evaluated for this indicator</i>	33,064,059	96.0%
	<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

To learn more and explore the GIS data, [view this indicator in the SECAS Atlas](#).

## Coastal & marine Seagrasses

This indicator represents the presence of seagrass in the Atlantic Ocean and Gulf of Mexico. Seagrasses provide food and habitat for a range of marine and estuarine wildlife, including fish, sea turtles, shrimp, crabs, oysters, and more. They also produce oxygen, filter water, control erosion, and buffer storms. Seagrasses serve as an important indicator of the overall health of coastal ecosystems because they are sensitive to water quality and require sufficiently clear water for sunlight to penetrate. This indicator originates from the National Oceanic and Atmospheric Administration's Marine Cadastre.

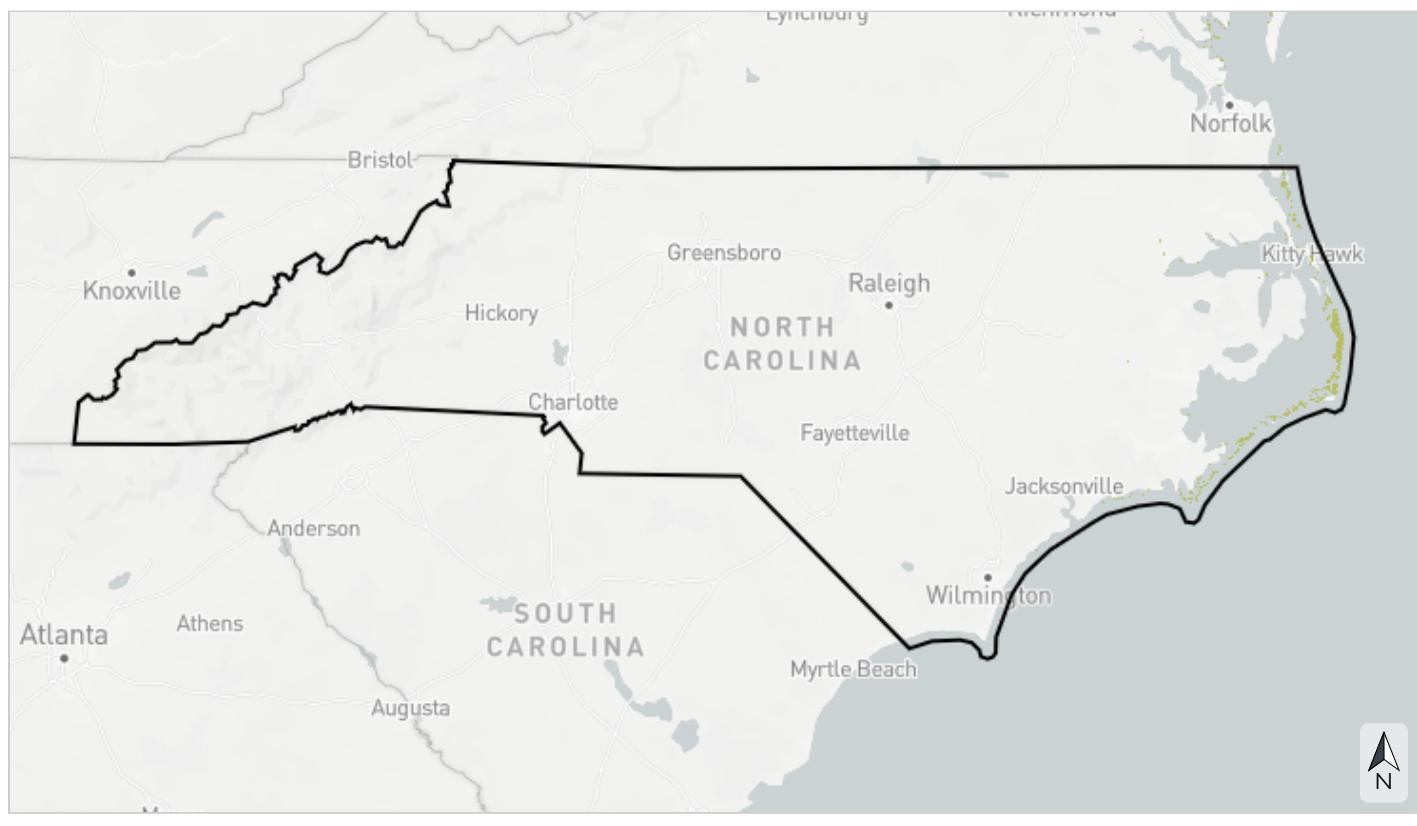

Table 27: Indicator values for seagrasses in this area. A good condition threshold is not yet defined for this indicator.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Seagrasses present	138,206	0.4%
	<i>Area not evaluated for this indicator</i>	34,305,624	99.6%

Coastal &amp; marine

## South Atlantic beach birds

This indicator is an index of habitat suitability for four shorebird species (American oystercatcher, Wilson's plover, least tern, piping plover) in the South Atlantic, based on observed abundance. The relative use of beach habitat by shorebirds for nesting, foraging, and breeding is an indicator of beach health and quality. It originates from data collected by waterbird biologists from the U.S. Fish and Wildlife Service and state wildlife agencies in Florida, Georgia, South Carolina and North Carolina.

- >80th percentile of importance for bird index species (American oystercatcher, Wilson's plover, least tern, and piping plover)
- >60th-80th percentile of importance
- >40th-60th percentile of importance
- >20th-40th percentile of importance
- ≤20th percentile of importance for bird index species

Table 28: Indicator values for South Atlantic beach birds in this area. A good condition threshold is not yet defined for this indicator.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	>80th percentile of importance for bird index species (American oystercatcher, Wilson's plover, least tern, and piping plover)	8,923	<0.1%
	>60th-80th percentile of importance	13,994	<0.1%
	>40th-60th percentile of importance	12,774	<0.1%
↓ Low	>20th-40th percentile of importance	12,103	<0.1%
	≤20th percentile of importance for bird index species	10,746	<0.1%
	<i>Area not evaluated for this indicator</i>	34,385,291	99.8%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

Coastal &amp; marine

## South Atlantic hardbottom & deep-sea coral

This indicator measures known and predicted suitable locations of hardbottom habitat and deep-sea corals. Hardbottom provides an anchor for important seafloor habitats such as deep-sea corals, plants, and sponges. Hardbottom and associated deep-sea coral communities provide valuable habitat structure that supports a wide range of invertebrate and fish species. This indicator combines multiple datasets from the National Oceanic and Atmospheric Administration and The Nature Conservancy.

- Observed coral or hardbottom
- Very high suitability for coral or hardbottom
- High suitability for coral or hardbottom
- Medium suitability for coral or hardbottom
- Low suitability for coral or hardbottom

Table 29: Indicator values for South Atlantic hardbottom & deep-sea coral in this area. A good condition threshold is not yet defined for this indicator.

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	Observed coral or hardbottom	27	<0.1%
	Very high suitability for coral or hardbottom	1,141	<0.1%
	High suitability for coral or hardbottom	5,145	<0.1%
	Medium suitability for coral or hardbottom	5,954	<0.1%
↓ Low	Low suitability for coral or hardbottom	51,484	0.1%
	<i>Area not evaluated for this indicator</i>	34,380,080	99.8%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

Coastal &amp; marine

## South Atlantic marine mammals

This indicator is a continuous index of dolphin and whale density based on monthly density predictions for ten species of cetaceans and yearly density predictions for three rarer cetacean species (monthly: North Atlantic right whale, sperm whale, Sei whale, humpback whale, fin whale, bottlenose dolphin, short-beaked common dolphin, Risso's dolphin, harbor porpoise, and Atlantic white-sided dolphin; yearly: pilot whale, beaked whale, striped dolphin). This indicator originates from Duke Marine Lab marine mammal models.

- >80th percentile of importance for marine mammal index species
- >60th-80th percentile of importance
- >40th-60th percentile of importance
- >20th-40th percentile of importance
- ≤20th percentile of importance

*Table 30: Indicator values for South Atlantic marine mammals in this area. A good condition threshold is not yet defined for this indicator.*

	<b>Indicator Values</b>	<b>Acres</b>	<b>Percent of Area</b>
↑ High	>80th percentile of importance for marine mammal index species	10,783	<0.1%
	>60th-80th percentile of importance	777	<0.1%
	>40th-60th percentile of importance	0	0%
	>20th-40th percentile of importance	0	0%
	≤20th percentile of importance	0	0%
	<i>Area not evaluated for this indicator</i>	34,432,270	100.0%
<b>Total area</b>		<b>34,443,830</b>	<b>100%</b>

Coastal &amp; marine

## South Atlantic marine birds

This indicator is a continuous index of highly productive areas for birds that feed exclusively or mainly at sea. It uses seasonal predictions of relative abundance for seventeen species of marine birds (Audubon's shearwater, white-winged scoter, black scoter, horned grebe, band-rumped storm-petrel, Bermuda petrel, Manx shearwater, black-capped petrel, Northern gannet, Bonaparte's gull, common loon, red-throated loon, Cory's shearwater, royal tern, great shearwater, sooty shearwater, common tern). This indicator originates from Marine-life Data and Analysis Team marine bird models.

- >80th percentile of importance for marine bird index species
- >60th-80th percentile of importance
- >40th-60th percentile of importance
- >20th-40th percentile of importance
- ≤20th percentile of importance

*Table 31: Indicator values for South Atlantic marine birds in this area. A good condition threshold is not yet defined for this indicator.*

<b>Indicator Values</b>		<b>Acres</b>	<b>Percent of Area</b>

## South Atlantic maritime forest

This indicator depicts maritime forest currently present in the South Atlantic. Since maritime forest has been substantially reduced from its historic extent, protecting the remaining acreage of existing maritime forest is important. This indicator originates from Landfire Existing Vegetation Type data.

Maritime forest

Table 32: Indicator values for South Atlantic maritime forest in this area. A good condition threshold is not yet defined for this indicator.

Indicator Values		Acres	Percent of Area
↑ High	Maritime forest	43,111	0.1%
	<i>Area not evaluated for this indicator</i>	34,400,719	99.9%
	<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

## Stable coastal wetlands

This indicator uses remote sensing to calculate the unvegetated-vegetated ratio of tidal wetlands, which compares how much of a wetland is not covered by plants (e.g., sediment, rocks, open water) to how much is covered by plants. This ratio, and how it changes over time, is a good surrogate for salt marsh degradation processes like sediment loss and conversion to open water. It helps differentiate between stable marshes that are more resilient, and declining marshes that are more vulnerable to threats like sea-level rise, erosion, and coastal development. This indicator originates from a U.S. Geological Survey project on an unvegetated to vegetated ratio for coastal wetlands.

# Threats

## Sea-level rise

NOAA's sea-level rise (SLR) inundation models represent areas likely to experience flooding at high tide based on each foot of inundation depth above current levels. These inundation depth models are not linked to a future timeframe; see the projections below. NOAA calculates the inundation depth at "mean higher high water", or the average highest daily tide. The area covered by each inundation depth level includes areas projected to be inundated at lower levels. For example, areas inundated by 4 ft of SLR also includes areas inundated by 3 ft, 2 ft, 1 ft, and current inundation levels.

To explore additional SLR information, please see NOAA's [Sea Level Rise Viewer](#).

Flooding extent by projected sea-level rise (ft)

Table 34: Extent of flooding by projected average highest daily tide due to sea level rise in this area. Values from the [NOAA sea-level rise inundation data](#).

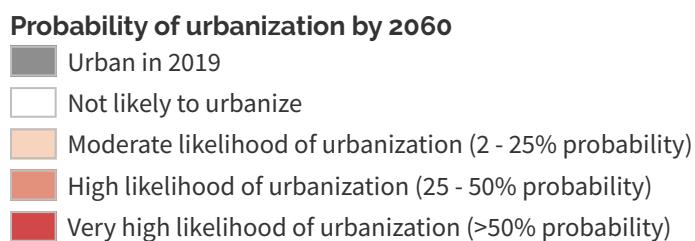

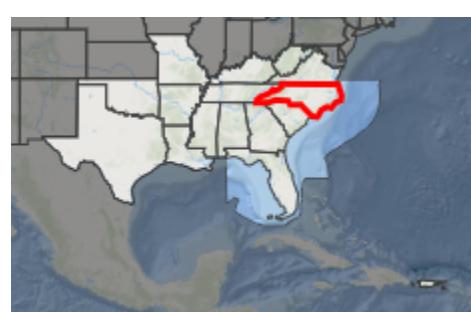

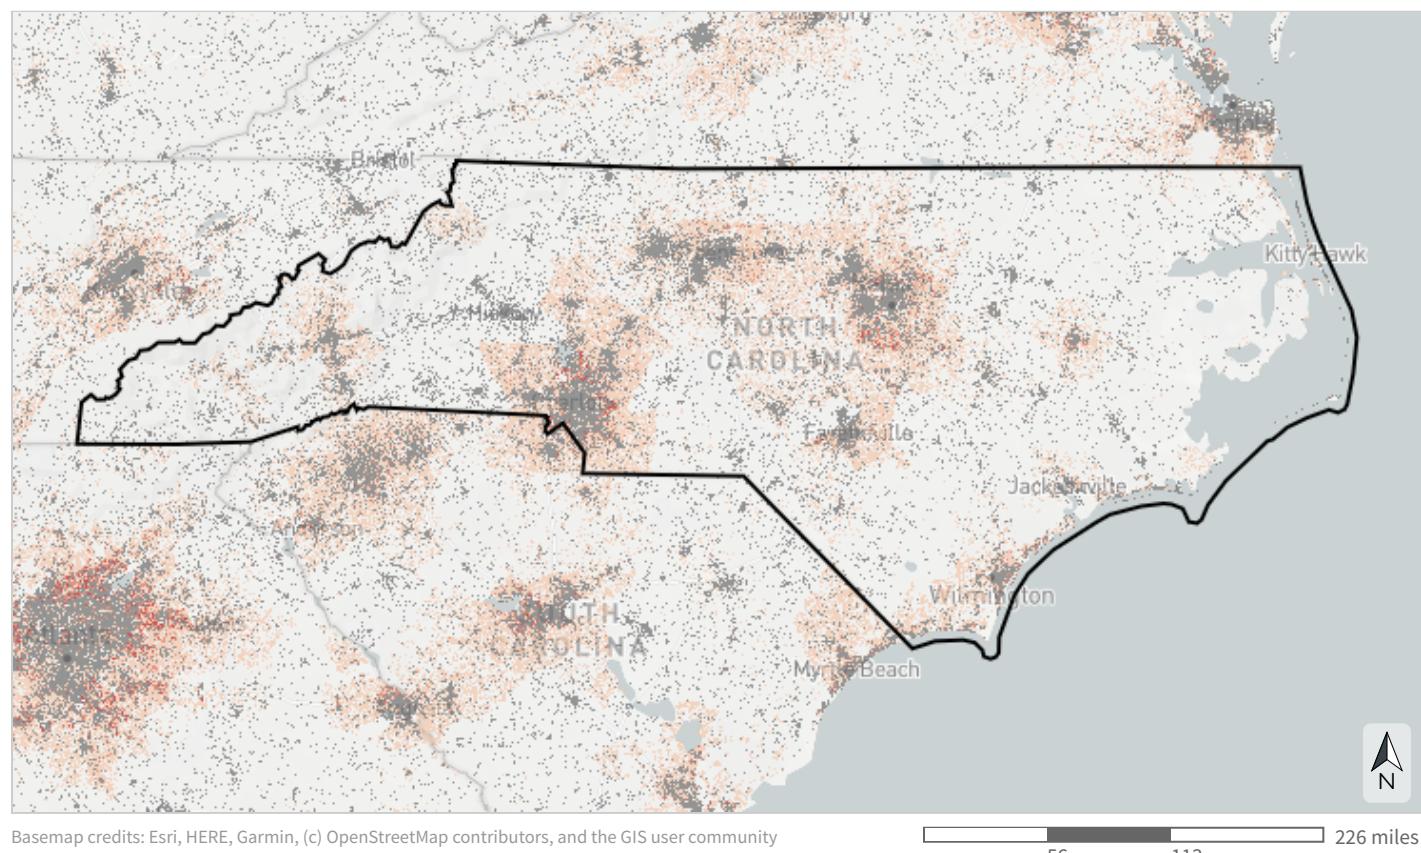

Feet of sea-level rise	Acres	Percent of Area
0 feet	3,031,797	8.8%
1 foot	3,218,090	9.3%
2 feet	3,774,827	11.0%
3 feet	4,109,331	11.9%
4 feet	4,304,195	12.5%
5 feet	4,454,697	12.9%
6 feet	4,609,281	13.4%
7 feet	4,760,701	13.8%
8 feet	4,910,144	14.3%
9 feet	5,040,470	14.6%
10 feet	5,169,378	15.0%
<i>Not projected to be inundated by up to 10 feet</i>	8,688,390	25.2%
<i>Sea-level rise unlikely to be a threat (inland counties)</i>	20,586,062	59.8%
<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

Table 35: Projected sea level rise by decade in this area. Values are based on area-weighted averages of decadal projections for 1-degree grid cells that overlap this area based on [NOAA's 2022 Sea Level Rise Report](#). 2060 corresponds to the [SECAS goal](#): a 10% or greater improvement in the health, function, and connectivity of Southeastern ecosystems by 2060.

SLR Scenario	2020 (ft)	2030 (ft)	2040 (ft)	2050 (ft)	2060 (ft)	2070 (ft)	2080 (ft)	2090 (ft)	2100 (ft)
Low	0.38	0.6	0.83	1	1.2	1.3	1.4	1.5	1.7
Intermediate-low	0.41	0.65	0.91	1.1	1.4	1.6	1.8	2.1	2.3
Intermediate	0.41	0.68	0.96	1.2	1.6	2	2.5	3.1	3.8
Intermediate-high	0.42	0.71	1	1.4	2	2.6	3.4	4.2	5.2
High	0.42	0.72	1.1	1.6	2.3	3.3	4.3	5.5	6.7

## Urban growth

The FUTURES urban growth model predicts the likelihood that an area will urbanize at every decade from 2020 to 2100. Developed areas from the 2019 National Landcover Database serve as the baseline for current urban areas. The model simulates landscape change based on trends in population growth, local development suitability factors, and an urban patch-growing algorithm. It considers environmental drivers like distance to floodplain, slope, and available infrastructure, and even socio-economic status. The probability of urbanization for each area reflects how many times it urbanized out of 50 model runs.

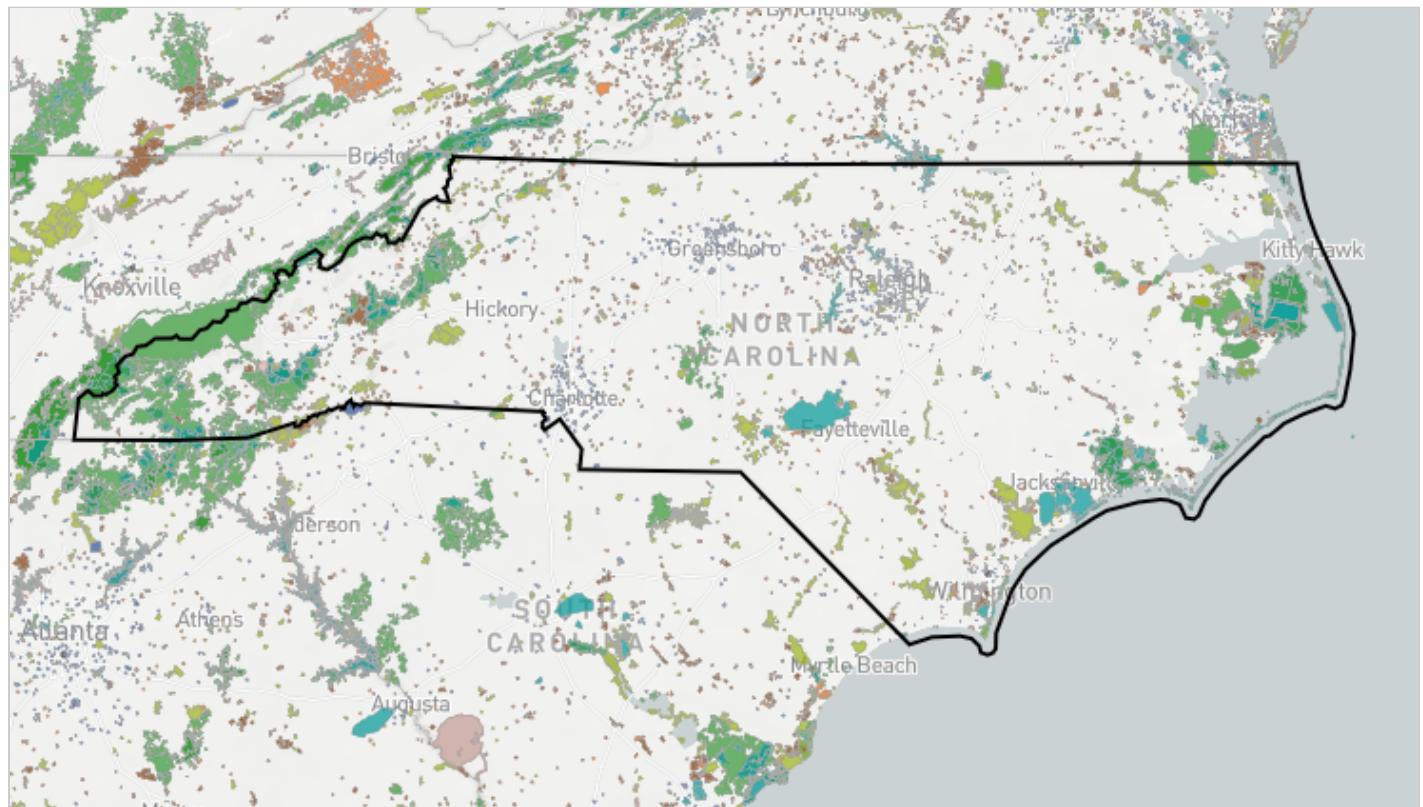

11.9% of this area is already urban in 2019, and an additional 13.4% has at least a moderate probability of urbanizing by 2060.

*Table 36: Extent of projected urbanization by decade in this area. Values from the FUTURES urban growth model. Data provided by the [Center for Geospatial Analytics](#), NC State University. 2060 corresponds to the [SECAS goal](#): a 10% or greater improvement in the health, function, and connectivity of Southeastern ecosystems by 2060.*

<b>Decade</b>	<b>Acres</b>	<b>Percent of Area</b>
Urban in 2019	4,089,807	11.9%
2020 projected extent	4,107,678	11.9%
2030 projected extent	4,206,350	12.2%
2040 projected extent	4,285,759	12.4%
2050 projected extent	4,348,826	12.6%
2060 projected extent	4,401,624	12.8%
2070 projected extent	4,449,796	12.9%
2080 projected extent	4,489,396	13.0%
2090 projected extent	4,516,511	13.1%
2100 projected extent	4,534,313	13.2%
<i>Not projected to urbanize by 2100</i>	24,960,958	72.5%
<b>Total area</b>	<b>34,443,830</b>	<b>100%</b>

# Ownership and Partners

## Conserved lands ownership

Basemap credits: Esri, HERE, Garmin, (c) OpenStreetMap contributors, and the GIS user community

56 113 226 miles

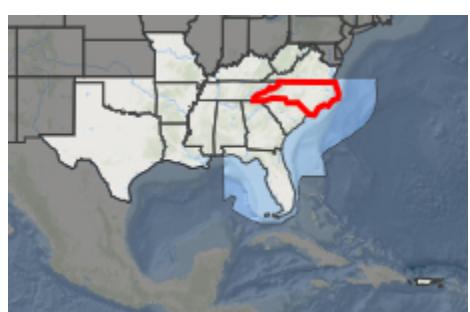

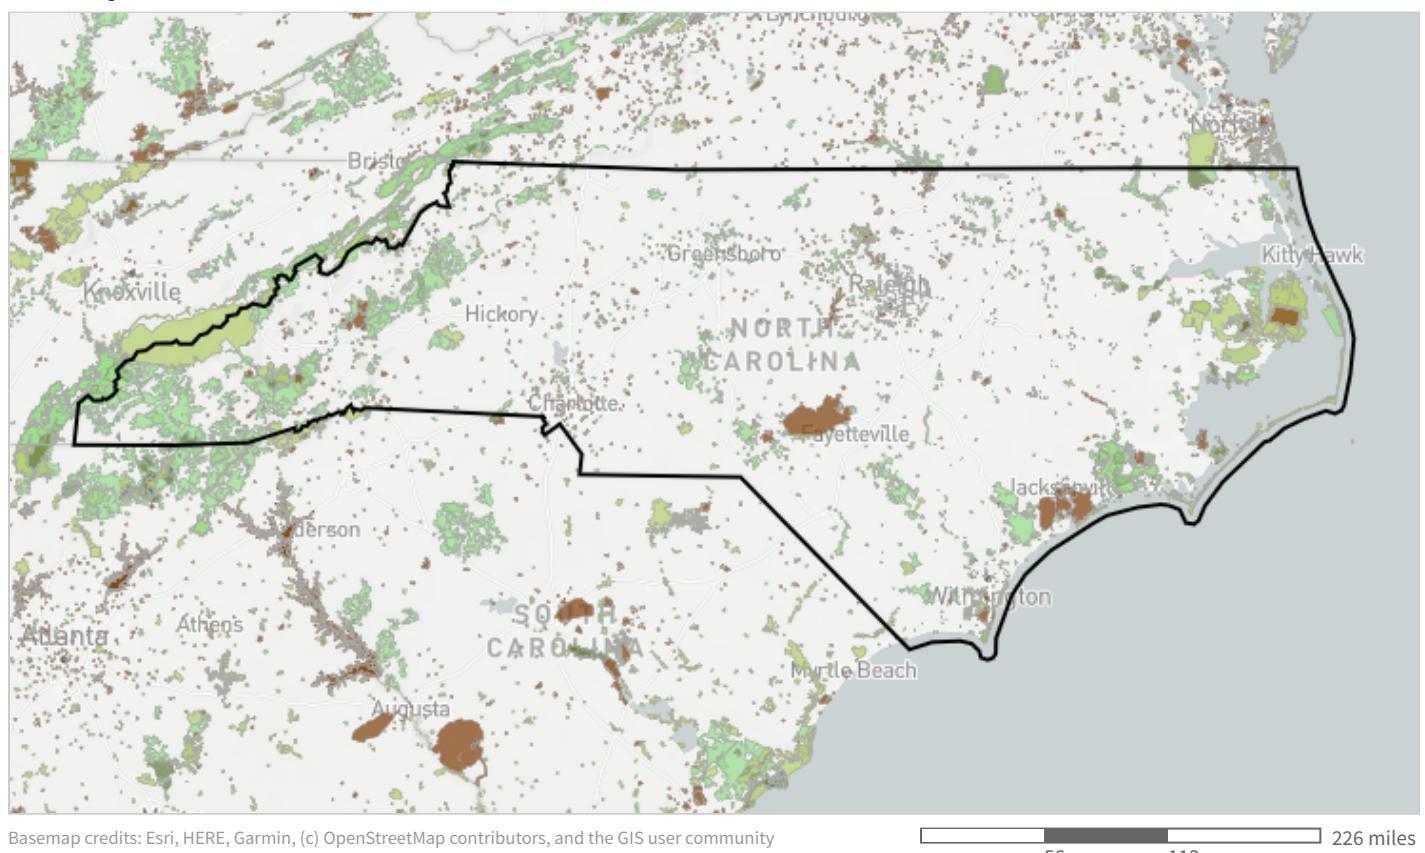

Federal	Joint
State/province	Private non-profit conserved lands
Territorial	Private conservation land
Regional	Tribal
Local	Designation
	Ownership unknown

Table 37: Extent of ownership class in this area. Protected areas are derived from the [Protected Areas Database of the United States](#) (PAD-US v3.0). Note: areas are based on the polygon boundary of this area compared to protected area polygons, rather than pixel-level analyses used elsewhere in this report.

<b>Ownership</b>	<b>Acres</b>	<b>Percent of Area</b>
Federal	2,052,739	6.0%
State/province	917,506	2.7%
Regional	1,413	<0.1%
Local	152,662	0.4%
Joint	17,399	<0.1%
Private non-profit conserved lands	76,727	0.2%
Private conservation land	342,846	1.0%
Tribal	69	<0.1%
Designation	1,469,724	4.3%
Ownership unknown	35,936	0.1%
<i>Not conserved</i>	29,376,806	85.3%
<b>Total area</b>	<b>34,443,825</b>	<b>100%</b>

## Land protection status

- Managed for biodiversity (disturbance events proceed or are mimicked)
- Managed for biodiversity (disturbance events suppressed)
- Managed for multiple uses (subject to extractive uses such as mining or logging, or OHV use)
- No known mandate for biodiversity protection

Table 38: Extent of land protection status in this area. Protected areas are derived from the [Protected Areas Database of the United States](#) (PAD-US v3.0). Note: areas are based on the polygon boundary of this area compared to protected area polygons, rather than pixel-level analyses used elsewhere in this report.

Land Protection Status	Acres	Percent of Area
Managed for biodiversity (disturbance events proceed or are mimicked)	251,413	0.7%
Managed for biodiversity (disturbance events suppressed)	1,729,336	5.0%
Managed for multiple uses (subject to extractive uses such as mining or logging, or OHV use)	2,412,604	7.0%
No known mandate for biodiversity protection	673,667	2.0%
<i>Not conserved</i>	29,376,806	85.3%
<b>Total area</b>	<b>34,443,825</b>	<b>100%</b>

## Protected Areas
